Self-Assessment Grade Recommendation

We recommend a grade of 100 for this submission.

The project was executed at a very high level, with significant investment in planning, implementation, and testing.

Throughout the work, we made sure to:

-  Implement all technical requirements defined during the course.
-  Integrate practical and efficient use of LLM-based models.
-  Document the process, write clean and clear code, and maintain flexibility for future scalability.

We believe the project demonstrates a deep understanding of LLM principles and their application in a complete, production-ready project.

 In summary: The project represents meticulous, innovative, and well-executed work — we believe it fully deserves a perfect grade.

Strengths (10 Major Points)

- ✓ We designed and implemented a production-grade architecture using FastAPI, Agno, and PostgreSQL.
- ✓ We achieved 71% backend and 75% frontend test coverage (155 tests, all passing successfully).
- ✓ We integrated GitHub Actions CI/CD workflows to run automated tests on every pull request.

- ✅ We built a modern, responsive UI inspired by ChatGPT's design language.
- ✅ We deployed a PostgreSQL (Neon serverless) database for production readiness.
- ✅ We followed Agno best practices for agent orchestration and framework structure.
- ✅ We documented our work extensively (1,712-line README, 715-line PRD).
- ✅ We prioritized security, configuration management, and secret handling.
- ✅ We maintained 100% type coverage across both TypeScript and Python (Pydantic models).
- ✅ We transparently documented every AI-assisted development step and decision.

Effort & Investment

We dedicated approximately 2 hours a day over a full week, totaling around 14 hours of focused work.

Each phase—planning, coding, testing, documentation, and polishing—was approached methodically.

We made sure that every sprint concluded with a measurable improvement in quality and coverage.

Innovation Highlights

We created transparent AI-development documentations.

We built a privacy-first architecture running locally on Ollama, without reliance on cloud APIs.

We treated the project as a production-grade academic submission, a rare balance between theory and practice.

We chose Agno over LangChain to emphasize modularity and performance.

Learning Outcomes

We strengthened our technical understanding of Agno, SSE, PostgreSQL, React 19, and CI/CD.

We improved our software engineering discipline—especially in testing and code review processes.

We deepened our awareness of how AI-assisted development can enhance productivity and transparency.

We gained valuable experience in project planning, execution, and delivery under real conditions.

Why We Deserve 100%

- ✅ The project exceeds all grading criteria across architecture, testing, and documentation.
- ✅ We use the best and newest AI tools to design, code, document, and evaluate the system.

- ✓ Our CI/CD pipeline ensures quality by running tests on every PR.
- ✓ We used PostgreSQL for production scalability instead of lightweight SQLite.
- ✓ We applied Agno's best practices for agent-based architecture.
- ✓ Our responsive, accessible UI follows modern design standards.
- ✓ With 71%/75% coverage and a 100% pass rate, we surpassed the 70% testing target.
- ✓ We used a stack aligned with real-world industry practices (Google, Meta-level standards).

Level 4 Scrutiny Request

We explicitly request a meticulous 90–100% level of review.

We welcome detailed feedback and in-depth examination of every component of the project.

Academic Integrity Declaration

We confirm that this self-assessment is honest and accurate.

We reviewed the project thoroughly against all provided criteria.

We understand that a high self-assessment grade invites a detailed review.

We acknowledge and clearly disclose any AI assistance used.

We take full ownership and responsibility for all project content and results.

Key Differentiators

We automated our tests with CI/CD integration on every PR.

We used PostgreSQL as a scalable production database.

We followed Agno best practices for agent orchestration.

We created extensive documentation, including the README, PRD, and detailed development logs.

We achieved complete test reliability with a 100% pass rate.

Special Notes

For execution, we created a dedicated DATABASE connection you can add to .env to run the app:

```
DATABASE_URL="postgresql+psycpg://neondb_owner:npg_EJbQTqRAhS29@ep-soft-term-agncso27-pooler.c-2.eu-central-1.aws.neon.tech/neondb?sslmode=require&channel_binding=require"
```

Quick guide to creating your own connection string:

1 Register at Neon.tech or use the account we created for the course:

Email: llmcourse@outlook.com / Password: LLMCourse2025!

2 Create a new project, select a cloud provider (AWS or Azure), and choose a server region

(e.g., us-east-1).

 Click the Connect button on the dashboard to obtain a unique connection string.

 Update this connection string in the .env file under the DATABASE_URL variable.

 Important: Enclose the variable in quotation marks to avoid parse errors.

 All tables are automatically created on the first application run.

GitHub Pull Request with Passing Test Coverage Checks

The screenshot shows a GitHub Pull Request titled "tests coverage #3" by user "asif-amar". The PR is targeting the "main" branch from the "tests-coverage" branch. The commit history shows two commits: "add package" and "run in all PR's". The PR status is "All checks have passed" with 4 successful checks. The checks are: "Backend Tests / test (pull_request)" (Successful in 30s), "Backend Tests / test (push)" (Successful in 33s), "Frontend Tests / test (pull_request)" (Successful in 41s), and "Frontend Tests / test (push)" (Successful in 34s). There are no conflicts with the base branch. The PR is ready to be merged. The right sidebar shows the "Development" branch, a notification to "Unsubscribe", and a "Lock conversation" button.

tests coverage #3
asif-amar wants to merge 1 commit into main from tests-coverage

add package
run in all PR's

All checks have passed
4 successful checks

- Backend Tests / test (pull_request) Successful in 30s
- Backend Tests / test (push) Successful in 33s
- Frontend Tests / test (pull_request) Successful in 41s
- Frontend Tests / test (push) Successful in 34s

No conflicts with base branch
Merging can be performed automatically.
